You can filter your search results based on a variety of criteria by using the "Modify" function.

As an example, let's do a keyword search for "international law" from the main Catalog search page.

This search is so broad that it is inefficient to sort through manually—at the time this tutorial was written, this search returned 20,086 results.

By using the "Modify" function, you can reduce the number of results by introducing additional criteria. In addition to containing the keywords "international" and "law" anywhere in the record, in order to appear in your list of results, a record will also have to meet your additional specifications.

From the search results page, click on “Modify Search” at the top of the page.

Notice that the keywords you entered, "international law," are still stored in the keyword search box field.
Scroll down to the “Limited To” section. Here you can enter your additional specifications such as location, language, type, date range, or publisher. Let’s limit our results to titles in Spanish, with the location “Web” which is our designation for electronic resources available on the web.

So from the Language list, select Spanish, and from the Location list, select Web.

Now click the “Submit” button or press enter on the keyboard.

At the time this tutorial was created, this search produced five results.
